

Quadrilaterals, triangles and octagons by Sofi Filippidi.

At the beginning, I would like to present the Olympic Stadium in Maroussi, that was designed by the famous Spanish architect Santiago Caltrava. This construction consists of a lot of quadrilaterals and especially rectangles, which are lined up one after the other. As the description is a little difficult have a look at the picture below!

In our town there is a lovely playground with triangle shape, full of trees. This playground is well designed in order to be easily accessible to the disabled. The ground is constructed to avoid injuries (from synthetic turf). Large, comfortable and with plenty of space for all children to play!

Finally, the Horologion of Andronikos Kyrristos is an ancient solar watch that was built by the Greek astronomer Andronikos from Kyrros of Macedonia (first half of the 1st century BC). The monument has octagonal shape. Its a tower (3.20 m. long on each side) that stands on a base of three steps. It is located in the center of Athens.
